INTRODUCTION

This document provides a simple guide to what thermal bridging is, the key construction details in new build housing where thermal bridging is particularly significant, examples of ways in which heat loss can be reduced by changes to the design and construction of these details, and the problem areas to avoid on site.

It is intended to help designers and builders focus on the key decisions that they can affect around junction detailing which will have a direct bearing on the performance of the new homes they help to deliver.

This Guide begins with a few explanatory pages describing what thermal bridges are and how their effects are quantified.

Key construction details are then illustrated for both masonry and timber frame construction showing how their thermal performance can either be improved or compromised by adopting alternative construction details, material specifications or site practices. This is the main part of the document.

The electronic version of this Guide also contains an Annex aimed at those who would like further information, covering: general principles to improve junction performance, the benefits in SAP of improved junction details, illustrated guidance to identify all relevant linear thermal bridges, how to establish the key junctions for a particular dwelling type, and a summary of the results of the PSI-value modelling work carried out for this Guide.

Please Note

⚠ The details drawn in this Guide are for illustrative purposes only and should not be used as working drawings. For example, consideration must also be given to structure, waterproofing, airtightness, general good practice and sequencing on site.

⚠ The PSI-values quoted in this Guide are for indicative purposes only and should not be used in SAP calculations.

Various sources exist to obtain PSI-values for the building junctions of interest, as follows:

- Generic industry sponsored libraries covering the common building types e.g. LABC (<http://www.labc.co.uk/registration-schemes/construction-details>) or Scottish Standards (<http://www.gov.scot/Topics/Built-Environment/Building/Building-standards/publications/pubtech>)
- Individual product or building system manufacturer sponsored libraries, covering specific building products/systems.
- Bespoke PSI-values calculated by 'competent persons' for specific developments.

UNDERSTANDING THE DETAIL PAGES

Construction type:

Masonry

Timber Frame

Construction detail type
(with SAP Table K1 reference)

Primary responsibility:
Designer Builder

COLD ROOF E10 EAVES

BASE DETAIL (PSI 0.06): 45° pitched roof with standard truss heel and cantilever to create eaves depth. Includes labels for eaves ventilator, eaves insulation, 300mm loft insulation, plasterboard ceiling, partial fill cavity, plasterboard on plaster dabs, brickwork, and dense aggregate blockwork.

IMPROVED DETAIL (PSI 0.04): Increase the eaves insulation depth 'X' to improve eaves performance. Note: this may influence the truss design (see further notes). Includes label for sub-and truss to create additional depth at eaves.

PROBLEM TO AVOID (PSI 0.54): Omitting roof insulation at eaves has a profound impact on heat loss. Includes label for roof insulation curtailed at eaves.

FURTHER NOTES: ADVISE TRUSS DESIGNERS OF INSULATION SPACE REQUIREMENTS. Specifying the desired roof pitch (p°), eaves overhang (a) and eaves insulation depth (b) will enable truss designers to select the most appropriate truss heel detail to meet these requirements.

COLD ROOF E10 EAVES

BASE DETAIL (PSI 0.06): 45° pitched roof with standard truss heel and cantilever to create eaves depth. Includes labels for eaves ventilator, eaves insulation, 300mm loft insulation, plasterboard ceiling, partial fill cavity, plasterboard on plaster dabs, brickwork, and dense aggregate blockwork.

IMPROVED DETAIL (PSI 0.04): Use insulated plasterboard on inner blockwork leaf to improve eaves performance. Includes label for eaves insulation depth 'X' = 100mm and use a thermal break plasterboard.

PROBLEM TO AVOID (PSI 0.36): Omitting soffit insulation has a severe impact on heat loss at eaves. Includes label for eaves insulation omitted at top and a 'BLACK MOULD PROBABLE' icon.

16 NOTE: The PSI-values quoted in this Guide are for indicative purposes only and should not be used in SAP calculations THERMAL BRIDGING GUIDE | ZERO CARBON HUB 17

blue arrows

WHAT ARE THERMAL BRIDGES?

A thermal bridge (sometimes called a cold bridge) is a localised weakness or discontinuity in the thermal envelope of a building. They generally occur when the insulation layer is interrupted by a more conductive material.

The type of thermal bridges considered in this Guide are called non-repeating or linear thermal bridges. These occur at junctions between elements, such as a wall and a floor or a window and a wall. At these locations heat is more able to transfer through the construction, resulting in greater heat loss from the dwelling and localised ‘cold spots’ in the building envelope.

Improving junction details to reduce linear thermal bridging will help achieve Building Regulations compliance and is one component in achieving healthy low energy homes.

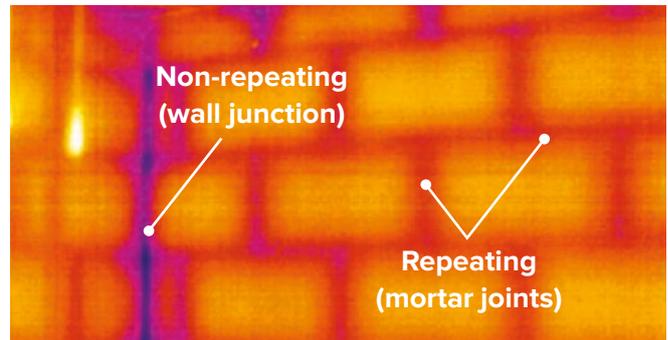

THE EFFECTS OF THERMAL BRIDGES

Increased heat loss

Thermal bridges can account for 20-30% of the heat loss in a typical new build home. As homes become better insulated thermal bridges become even more significant.

Localised ‘cold-spots’

Sometimes leading to condensation build-up or mould growth.

REPEATING AND NON-REPEATING THERMAL BRIDGES

There are two types of thermal bridges in buildings - repeating and non-repeating thermal bridges.

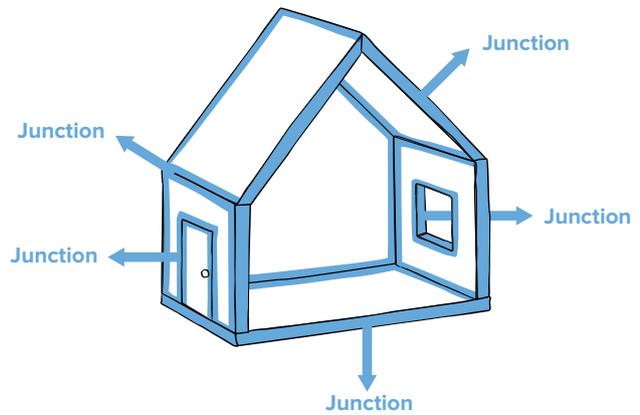

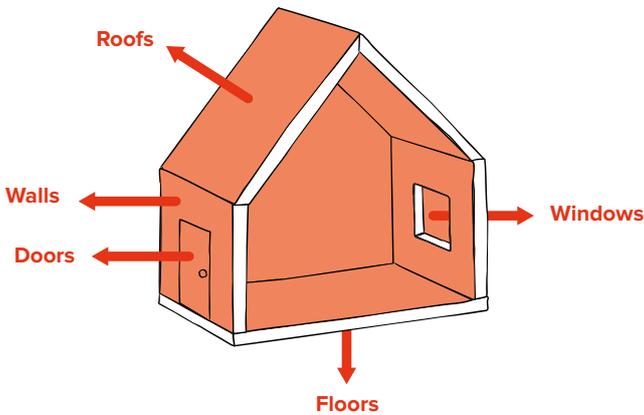

Examples of **repeating** thermal bridges are mortar joints and wall-ties in masonry construction or timber or steel studs in framed construction. Where the frequency of these is known and consistent their effects can be accounted for directly in the U-value calculation for the building element itself.

The remaining **non-repeating** thermal bridges are dealt with by “PSI-values” – pronounced ‘Si’ (silent p), and designated by the Greek letter ‘ ψ ’. Their effects on heat loss are calculated by thermal modelling software, and they are accounted for separately in SAP calculations in addition to U-values.

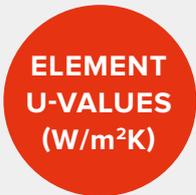

KEY JUNCTIONS

Although there are many junctions within a dwelling, some have extremely low PSI-values and others occur over very short lengths. The key junctions to ‘get right’ or improve are those which either have a high PSI-value or occur frequently over significant lengths. Although the particular junctions of interest will vary depending on dwelling type and design, this Guide covers the key junctions considered by the authors to be the most significant across a range of dwelling types.

HOW IS FABRIC HEAT LOSS QUANTIFIED?

ELEMENT LOSSES

Quantify the heat loss from each of the external building elements such as floors, walls, windows, doors etc. The area of each element multiplied by its **U-value** gives its anticipated heat loss.

THERMAL BRIDGE LOSSES

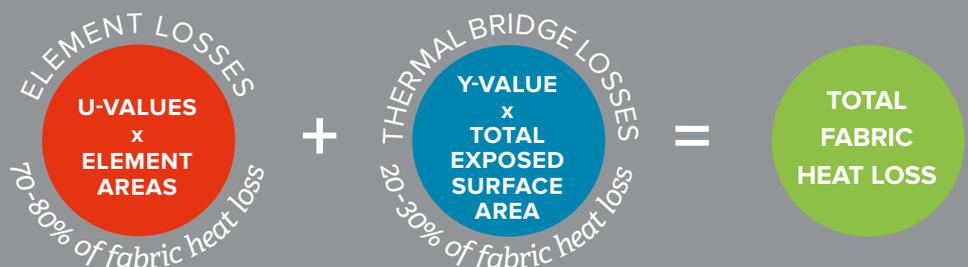

Quantify the heat loss from each of the junctions where the building elements meet (thermal bridges). Multiplying the junction **PSI-value** by the junction length gives the junction heat loss.

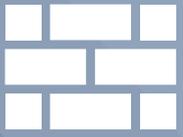

The sum of the individual junction heat losses divided by the total exposed surface area of the dwelling gives the **Y-value**. The Y-value expresses the overall heat loss arising from all of the building junctions as an equivalent U-value for the dwelling.

In SAP fabric heat loss is quantified by a combination of U-values and Y-values

Note: Lower U-values, Y-values and PSI-values will result in lower fabric heat loss.

MASONRY CONSTRUCTION

✓ KEY DESIGN RECOMMENDATIONS

	Design recommendation	No. of junctions affected	Junction references
1	Use a split or thermally broken lintel	1	E2 (page 8)
2	Use light aggregate blockwork inner leaf	4	E5, P1, E12, P4 (pages 12, 14, 18, 20)
3	Use a PU/PIR cavity closer	3	E2, E3, E4 (pages 8, 10)
4	Use insulated plasterboard on the inner leaf	5	E2, E4, E10, E12, P4 (pages 8, 10, 16, 18, 20)
5	Use a window frame overlap of min. 50mm	3	E2, E3, E4 (pages 8, 10)
6	Increase eaves insulation depth	1	E10 (page 16)

✗ KEY PROBLEMS TO AVOID

	Problem / site check	No. of junctions affected	Junction references	Black mould risk
1	Omitting rafter insulation at eaves	1	E10 (page 16)	
2	Omitting insulation between truss and wall	2	E12, P4 (pages 18, 20)	
3	Omitting soffit insulation at eaves	1	E10 (page 16)	
4	Stopping party wall cavity insulation short of loft	1	P4 (page 20)	
5	Swapping a split lintel with a perforated steel lintel	1	E2 (page 8)	
6	Omitting the cavity closure	3	E2, E3, E4 (pages 8, 10)	
7	Omitting cavity insulation below DPC	2	E5, P1 (pages 12, 14)	
8	Omitting floor perimeter insulation	2	E5, P1 (pages 12, 14)	
9	No window frame overlap with cavity	3	E2, E3, E4 (page 8, 10)	

INDEPENDENT LINTEL E2 LINTELS

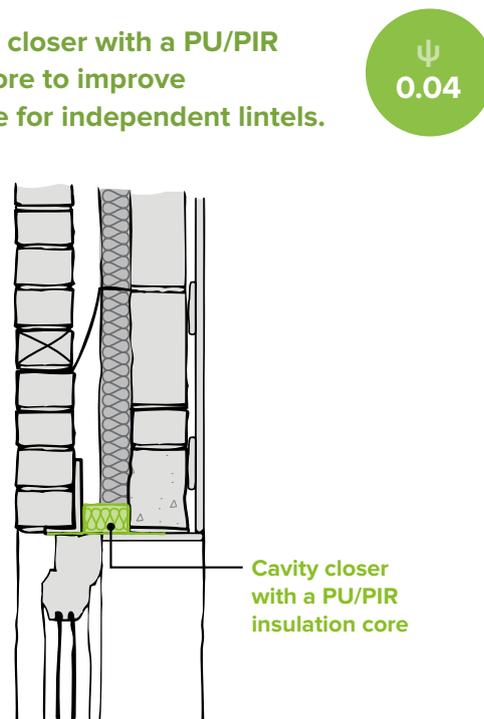

BASE DETAIL

IMPROVED DETAIL

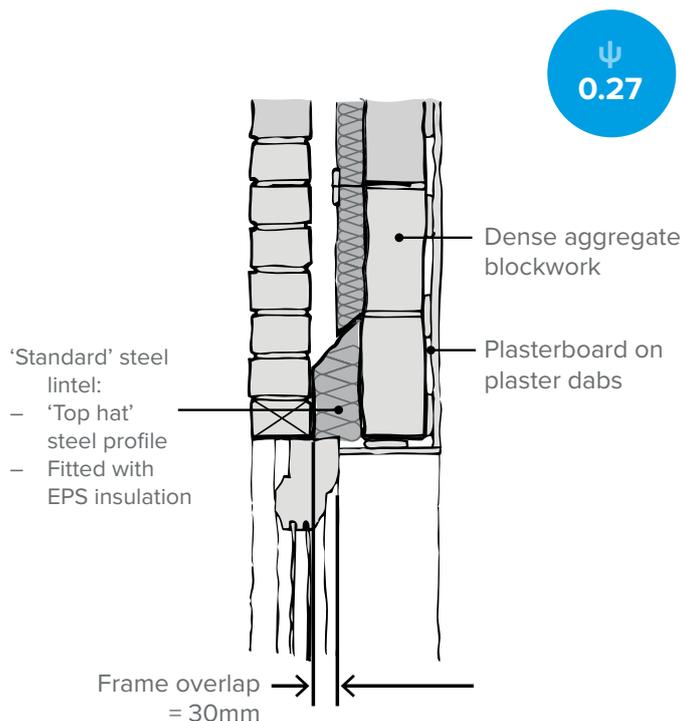

Use a cavity closer with a PU/PIR insulation core to improve performance for independent lintels.

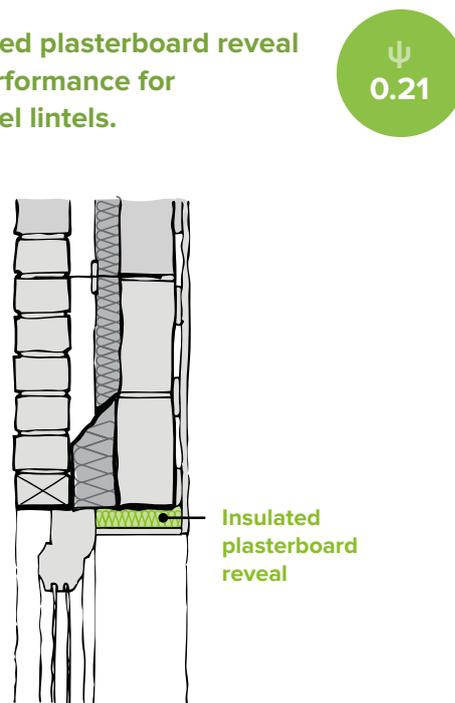

PERFORATED STEEL LINTEL E2 LINTELS

BASE DETAIL

IMPROVED DETAIL

Use an insulated plasterboard reveal to improve performance for perforated steel lintels.

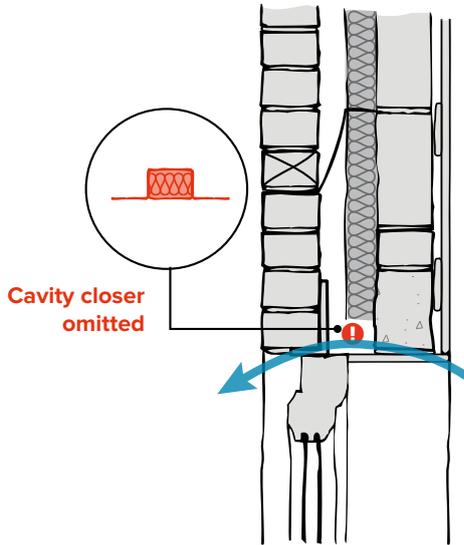

✘ PROBLEM TO AVOID

Omitting the cavity closer makes heat loss significantly worse.

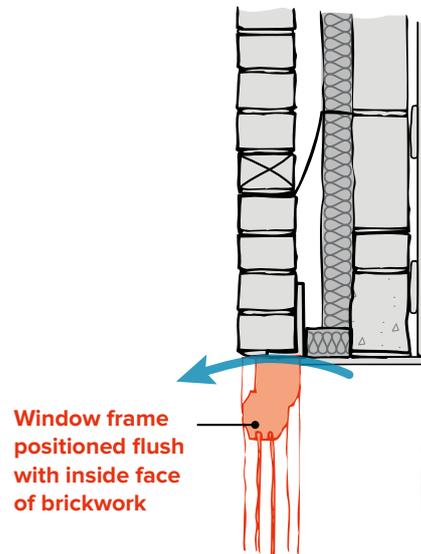

ψ
0.26

✘ PROBLEM TO AVOID

Reducing the frame overlap to 0mm makes heat loss worse.

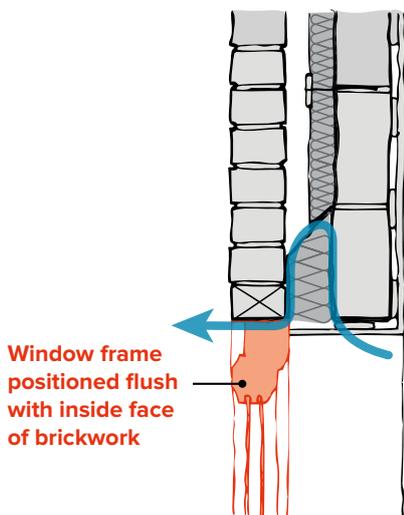

ψ
0.15

✘ PROBLEM TO AVOID

Reducing the frame overlap to 0mm makes heat loss worse.

ψ
0.31

✎ FURTHER NOTES

✓ LINTEL SELECTION

Independent lintels have ψ -values approximately $\psi = 0.2$ lower than perforated steel lintels.

✓ FRAME OVERLAP

Increasing the frame overlap from 30mm to 50mm will also reduce the ψ -value of lintels, sills and jambs by approximately $\psi = 0.02$.
