

Ducts/flues through core drilled holes

(March 2024) (Second issue – supersedes December 2008)

The Technical Guidance Notes are produced by NHBC as guidance solely for our builder customers as to how to interpret the technical requirements in relation to the warranty cover provided by NHBC under its Buildmark, Buildmark Choice, Buildmark Link, Buildmark Solo, Buildmark Connect or any similar product from time to time. It has not been created or intended for distribution or use outside of that purpose. The information contained in this Technical Guidance Note does not constitute advice and is not to be relied upon by any third party. Nothing in this Technical Guidance Note is intended to, nor should it be taken to, create any legal or contractual relationship. Any third party who chooses to rely upon the information contained in the Technical Guidance Notes shall do so entirely at their own risk and NHBC accepts no duty of care or liability, however caused, in connection with its use or reliance by any third party.

Question

Is it acceptable to install fan ducts and boiler flues through core drilled holes in external masonry walls without a cavity tray above?

Considerations

- NHBC Standards clauses 6.1.17 and 6.8.12 refer to the provision of cavity trays to air bricks ducts and moisture drip collars to balanced flues to avoid water gathering on the ducts/flues and crossing the cavity to the inner leaf.
- Circular ducts/flues to extract fans and boilers when installed with a slight fall to outside helps to direct moisture back on to the outer leaf of the wall.
- The installation of the duct/flue through core drilled holes is usually after completion of the wall when the risk of mortar droppings gathering on the duct/flue and bridging the cavity has passed.
- Careful setting out is required to correctly position cavity trays at the time of constructing the walls to suit the later provision of a core drilled hole for ducts/flues etc.

Answer

Where a duct to an extract fan is built-in as the wall is constructed it should be provided with a cavity tray to protect the duct from mortar droppings, which could bridge the cavity and cause dampness.

Where a duct to an extract fan or boiler flue is installed through a core-drilled hole after completion of the wall it is not essential to provide a cavity tray although the provision of a tray during the construction of the wall is considered good practice.
