

# Strip/trench fill foundations – slip membranes

(December 2008) (First issue)

## Question

Is a slip membrane needed to the outer face of the excavation for a strip/trench fill foundation in shrinkable soil?

## Considerations

- The vertical face of the excavation needs to be sufficiently smooth to allow movement of the soil to take place without disturbing the foundation.
- A slip membrane would do little to reduce the friction between the clay and the foundation.

## Answer

A slip membrane is not needed. The vertical face of the excavation should be reasonably smooth.
